ITEC 204 – Data Structures and Algorithms

Name: Herradura, Beldric Joaquin D.	Date: 09/25/26
Section: BSIT 2B	Instructor: Maxyne Nuela Ignacio

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer:

The program is designed to manage and organize active incident tickets using a linear data structure. It allows the user to add, display, search, and remove incident tickets through a menu-driven system. The program also counts the total number of active incident tickets and provides error messages when the user enters invalid information.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Add Incident: incidents.append([incident_id, bot, description])

Display Incidents: for ticket in incidents:

```
print(f'{ticket[0]:<15} {ticket[1]:<20} {ticket[2]}')
```

Search Incident: for ticket in incidents:

```
if ticket[0] == incident_id:
```

Remove Resolved Incident: incidents.remove(ticket)

Count Active Incidents: print("Total active incident tickets:", len(incidents))

Flowchart: Create a flowchart showing the overall process and logic of your program.

- III. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

Answer:

Through this activity, I learned how to create a menu-driven program for managing incident tickets. I also learned how to use a linear data structure, specifically a **list**, to store and manage multiple incident tickets. The list allows the program to easily add, search, display, remove, and count incident tickets while keeping track of the active tickets.
